The graph below is an extract from the FOREST EUROPE (FE) relevance index (available for internal use only).

The graph represents the most frequent thematic categories extracted from the FE relevance index. The categorisation is carried out through a qualitative analysis[1], using FE declarations and resolutions as the primary source.

Categories' frequency

[1] The qualitative analysis focuses on the subjective understanding of the content of FE resolutions and declarations (i.e. focus on the comprehension of the text). In the first stage, these documents are screened carefully, highlighting the most relevant information in each paragraph, and inserting key words based on the specific subject mentioned. In a second stage, general categories are identified and assigned to each paragraph based on the key words reported.
